Problem 1. Let a and c be real numbers.

- (a) Show that if g(x) = f(x a), then $\hat{g}(k) = e^{ika} \hat{f}(k)$.
- (b) Use the Fourier transform and part (a) to solve the transport PDE

$$\begin{cases} u_t + cu_x = 0 \\ u(x,0) = f(x) \end{cases}$$

Solution.

(a)

$$\hat{g}(k) = \int_{-\infty}^{\infty} g(x)e^{-ikx}dx$$

$$= \int_{-\infty}^{\infty} f(x-a)e^{-ikx}dx$$

$$= \int_{-\infty}^{\infty} f(y)e^{-ik(y+a)}dy \quad (\text{let } y = x-a)$$

$$= e^{ika} \int_{-\infty}^{\infty} f(y)e^{-iky}dy$$

$$= e^{ika} \hat{f}(k).$$

(b)

$$\begin{aligned} u_t(x,t) &= -cu_x(x,t) \\ \hat{u}_t(k,t) &= \int_{-\infty}^{\infty} -cu_x(x,t)e^{-ikx}dx \\ &= -c\int_{-\infty}^{\infty} u_x(x,t)e^{-ikx}dx \\ &= -c\left[u(x,t)e^{-ikx}\right]_{-\infty}^{\infty} + c\int_{-\infty}^{\infty} u(x,t)ike^{-ikx}dx \\ &= cik\hat{u}(k,t). \end{aligned}$$

We have the ODE $\hat{u}_t(k,t) = cik\hat{u}(k,t)$, which has the solution $\hat{u}(k,t) = \hat{u}(k,0)e^{cikt} = \hat{f}(k)e^{cikt}$. Using part (a), we have

$$u(x,t) = f(x - ct)$$

which is the solution to the transport PDE.

Problem 2. Consider the heat equation $u_t = Du_{xx}$ with $x \in \mathbb{R}$ and D > 0.

- (a) For each $k \in \mathbb{R}$, find $\lambda = \lambda(k) \in \mathbb{R}$ so that $u(x, t) = e^{\lambda t} e^{ikx}$ satisfies the heat equation. Here $i = \sqrt{-1}$.
- (b) Assume that a(k) is Schwartz class in k. Show that $u(x,t) = \int_{-\infty}^{\infty} a(k)e^{\lambda(k)t}e^{ikx}dk$ satisfies the heat equation for t > 0.

Solution.

(a)

$$u_t(x,t) = \frac{\partial}{\partial t} e^{\lambda t} e^{ikx}$$
$$= \lambda e^{\lambda t} e^{ikx}$$
$$u_{xx}(x,t) = \frac{\partial^2}{\partial x^2} e^{\lambda t} e^{ikx}$$
$$= -k^2 e^{\lambda t} e^{ikx}.$$

$$u_t(x,t) = Du_{xx}(x,t) \implies \lambda e^{\lambda t} e^{ikx} = -Dk^2 e^{\lambda t} e^{ikx}.$$

$$\lambda(k) = -Dk^2.$$

(b)

$$u_{t}(x,t) = \int_{-\infty}^{\infty} a(k)\lambda(k)e^{\lambda(k)t}e^{ikx}dk = \int_{-\infty}^{\infty} a(k)(-Dk^{2})e^{-Dk^{2}t}e^{ikx}dk.$$

$$u_{xx}(x,t) = \int_{-\infty}^{\infty} a(k)(-k^{2})e^{-Dk^{2}t}e^{ikx}dk.$$

$$u_{t}(x,t) = Du_{xx}(x,t).$$

Note that $t \ge 0$ so that e^{-Dk^2t} is either 1 or Schwartz class.

Thus, $u(x, t) = \int_{-\infty}^{\infty} a(k)e^{\lambda(k)t}e^{ikx}dk$ satisfies the heat equation for $t \ge 0$.

Problem 3. Consider the equation $u_t = u_{xxxx}$ for $x \in \mathbb{R}$ with u(x,0) = f(x) where f(x) is Schwartz class. Derive an expression for the Fourier transform $\hat{u}(k,t)$ of the solution u(x,t) in terms of k, t, and $\hat{f}(k)$. (You do not need to find u(x,t) from $\hat{u}(k,t)$).

Solution.

$$u_t(x,t) = u_{xxxx}(x,t)$$

$$\hat{u}_t(k,t) = \int_{-\infty}^{\infty} u_{xxxx}(x,t)e^{-ikx}dx$$

$$= \int_{-\infty}^{\infty} u(x,t)(-ik)^4 e^{-ikx}dx$$

$$= (-ik)^4 \hat{u}(k,t)$$

$$= k^4 \hat{u}(k,t).$$

We have the ODE $\hat{u}_t(k,t) = k^4 \hat{u}(k,t)$, which has the solution $\hat{u}(k,t) = \hat{u}(k,0)e^{k^4t} = \hat{f}(k)e^{k^4t}$.

Problem 4.

- (a) For given D > 0 and $a, c \in \mathbb{R}$, consider the equation $u_t = Du_{xx} + cu_x au$ for $x \in \mathbb{R}$ and t > 0. Assume that u(x, t) is a solution of this equation. Verify that $v(x, t) := u(y ct, t)e^{at}$ is a solution of $v_t = Dv_{yy}$ for $y \in \mathbb{R}$ and t > 0.
- (b) Recall that (from HW1)

$$v(y,t) = \frac{1}{\sqrt{4\pi t}} e^{-\frac{y^2}{4t}}$$

satisfies $v_t = v_{yy}$ for $y \in \mathbb{R}$ and t > 0. Use the preceding part to find the solution u(x, t) to $u_t = u_{xx} + 2u_x - 0.5u$.

Solution.

(a)

$$\begin{aligned} v_t(x,t) &= \frac{\partial}{\partial t} u(y-ct,t) e^{at} \\ &= u_t(y-ct,t) e^{at} - cu_x(y-ct,t) e^{at} + au(y-ct,t) e^{at} \\ &= (Du_{xx}(y-ct,t) + cu_x(y-ct,t) - au(y-ct,t)) e^{at} - cu_x(y-ct,t) e^{at} + au(y-ct,t) e^{at} \\ &= Du_{xx}(y-ct,t) e^{at} \\ &= Dv_{yy}(x,t) \end{aligned}$$

(b) We have that D = 1, a = 2, and c = 0. Let $v(x, t) = u(y - ct, t)e^{at}$. Then

$$u_t = Du_{xx} + cu_x - au \implies v_t = Dv_{yy}.$$

Let y = x, c = 0, and a = 2. Then

$$v(x,t) = u(x,t)e^{2t}.$$

$$u(x,t) = v(x,t)e^{-2t} = \frac{1}{\sqrt{4\pi t}}e^{-\frac{x^2}{4t}}e^{-2t} = \frac{1}{\sqrt{4\pi t}}e^{-\frac{x^2}{4t}-2t}$$
