Problem 1. *Let a and c be real numbers.*

   (a) Show that if $g(x) = f(x - a)$, then $\hat{g}(k) = e^{ika}\hat{f}(k)$.

   (b) Use the Fourier transform and part (a) to solve the transport PDE

$$\begin{cases} u_t + cu_x = 0 \\ u(x,0) = f(x) \end{cases}$$

Solution.

   (a)

$$\hat{g}(k) = \int_{-\infty}^{\infty} g(x)e^{-ikx}dx$$
$$= \int_{-\infty}^{\infty} f(x-a)e^{-ikx}dx$$
$$= \int_{-\infty}^{\infty} f(y)e^{-ik(y+a)}dy \quad (\text{let } y = x - a)$$
$$= e^{ika}\int_{-\infty}^{\infty} f(y)e^{-iky}dy$$
$$= e^{ika}\hat{f}(k).$$

   (b)

$$u_t(x,t) = -cu_x(x,t)$$
$$\hat{u}_t(k,t) = \int_{-\infty}^{\infty} -cu_x(x,t)e^{-ikx}dx$$
$$= -c\int_{-\infty}^{\infty} u_x(x,t)e^{-ikx}dx$$
$$= -c\left[u(x,t)e^{-ikx}\right]_{-\infty}^{\infty} + c\int_{-\infty}^{\infty} u(x,t)ike^{-ikx}dx$$
$$= cik\hat{u}(k,t).$$

We have the ODE $\hat{u}_t(k,t) = cik\hat{u}(k,t)$, which has the solution $\hat{u}(k,t) = \hat{u}(k,0)e^{cikt} = \hat{f}(k)e^{cikt}$.
Using part (a), we have
$$u(x,t) = f(x - ct)$$
which is the solution to the transport PDE.

                                                         □

Problem 2. *Consider the heat equation $u_t = Du_{xx}$ with $x \in \mathbb{R}$ and $D > 0$.*

(a) *For each $k \in \mathbb{R}$, find $\lambda = \lambda(k) \in \mathbb{R}$ so that $u(x, t) = e^{\lambda t} e^{ikx}$ satisfies the heat equation. Here $i = \sqrt{-1}$.*

(b) *Assume that $a(k)$ is Schwartz class in k. Show that $u(x, t) = \int_{-\infty}^{\infty} a(k) e^{\lambda(k)t} e^{ikx} dk$ satisfies the heat equation for $t \geq 0$.*

Solution.

(a)

$$u_t(x, t) = \frac{\partial}{\partial t} e^{\lambda t} e^{ikx}$$
$$= \lambda e^{\lambda t} e^{ikx}$$
$$u_{xx}(x, t) = \frac{\partial^2}{\partial x^2} e^{\lambda t} e^{ikx}$$
$$= -k^2 e^{\lambda t} e^{ikx}.$$

$$u_t(x, t) = Du_{xx}(x, t) \implies \lambda e^{\lambda t} e^{ikx} = -Dk^2 e^{\lambda t} e^{ikx}.$$
$$\lambda(k) = -Dk^2.$$

(b)

$$u_t(x, t) = \int_{-\infty}^{\infty} a(k)\lambda(k) e^{\lambda(k)t} e^{ikx} dk = \int_{-\infty}^{\infty} a(k)(-Dk^2) e^{-Dk^2 t} e^{ikx} dk.$$

$$u_{xx}(x, t) = \int_{-\infty}^{\infty} a(k)(-k^2) e^{-Dk^2 t} e^{ikx} dk.$$

$$u_t(x, t) = Du_{xx}(x, t).$$

Note that $t \geq 0$ so that $e^{-Dk^2 t}$ is either 1 or Schwartz class.

Thus, $u(x, t) = \int_{-\infty}^{\infty} a(k) e^{\lambda(k)t} e^{ikx} dk$ satisfies the heat equation for $t \geq 0$.

$\square$

Problem 3. *Consider the equation $u_t = u_{xxxx}$ for $x \in \mathbb{R}$ with $u(x,0) = f(x)$ where $f(x)$ is Schwartz class. Derive an expression for the Fourier transform $\hat{u}(k,t)$ of the solution $u(x,t)$ in terms of k, t, and $\hat{f}(k)$. (You do not need to find $u(x,t)$ from $\hat{u}(k,t)$).*

Solution.

$$u_t(x,t) = u_{xxxx}(x,t)$$

$$\hat{u}_t(k,t) = \int_{-\infty}^{\infty} u_{xxxx}(x,t)e^{-ikx}dx$$

$$= \int_{-\infty}^{\infty} u(x,t)(-ik)^4 e^{-ikx}dx$$

$$= (-ik)^4 \hat{u}(k,t)$$

$$= k^4 \hat{u}(k,t).$$

We have the ODE $\hat{u}_t(k,t) = k^4 \hat{u}(k,t)$, which has the solution $\hat{u}(k,t) = \hat{u}(k,0)e^{k^4 t} = \hat{f}(k)e^{k^4 t}$.

$\square$

Problem 4.

(a) For given $D > 0$ and $a, c \in \mathbb{R}$, consider the equation $u_t = Du_{xx} + cu_x - au$ for $x \in \mathbb{R}$ and $t > 0$. Assume that $u(x,t)$ is a solution of this equation. Verify that $v(x,t) := u(y - ct, t)e^{at}$ is a solution of $v_t = Dv_{yy}$ for $y \in \mathbb{R}$ and $t > 0$.

(b) Recall that (from HW1)

$$v(y,t) = \frac{1}{\sqrt{4\pi t}}e^{-\frac{y^2}{4t}}$$

satisfies $v_t = v_{yy}$ for $y \in \mathbb{R}$ and $t > 0$. Use the preceding part to find the solution $u(x,t)$ to $u_t = u_{xx} + 2u_x - 0.5u$.

Solution.

(a)

$$v_t(x,t) = \frac{\partial}{\partial t}u(y - ct, t)e^{at}$$
$$= u_t(y - ct, t)e^{at} - cu_x(y - ct, t)e^{at} + au(y - ct, t)e^{at}$$
$$= (Du_{xx}(y - ct, t) + cu_x(y - ct, t) - au(y - ct, t))e^{at} - cu_x(y - ct, t)e^{at} + au(y - ct, t)e^{at}$$
$$= Du_{xx}(y - ct, t)e^{at}$$
$$= Dv_{yy}(x,t)$$

(b) We have that $D = 1$, $a = 2$, and $c = 0$. Let $v(x,t) = u(y - ct, t)e^{at}$. Then

$$u_t = Du_{xx} + cu_x - au \implies v_t = Dv_{yy}.$$

Let $y = x$, $c = 0$, and $a = 2$. Then
$$v(x,t) = u(x,t)e^{2t}.$$
$$u(x,t) = v(x,t)e^{-2t} = \frac{1}{\sqrt{4\pi t}}e^{-\frac{x^2}{4t}}e^{-2t} = \frac{1}{\sqrt{4\pi t}}e^{-\frac{x^2}{4t}-2t}$$
